use in commercial applications like biotechnology and agriculture. The present sequence represents a woodchuck hepatitis virus regulator element (WRB) nucleotide sequence, which is used in an example from the present invention. (Updated on 27-ocr-2003 to standardise OS field)
                                                                                                                                                                                                                The present invention describes a method for producing a transgenic bird or fish. The method comprises transfecting a packaging cell line with a retroviral onstruct, recovering recombinant retroviral particles from the packaging cell line, and infecting a bird or a fish egg with the recombinant retroviral particles. The retroviral construct comprises the R and US sequences from a 5' lentiviral long terminal repeat (LTR) and a self-inactivating 3' lentiviral LTR. Also described is a transgenic bird or fish made by the above method whose genome comprises a proviral DNA that has a self-inactivating 3' lentiviral LTR. The method is useful using retroviral constructs engineered to carry a transgene of interest. The method is used to introduce the gene of choice into animals in order to confer upon them desired attributes. The transgenic animals may find
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Producing a transgenic bird or fish for commercial use, comprises transfecting a packaging cell line with retroviral construct, recovering recombinant retrovirus from the cell and infecting bird or fish egg with

The invention relates to a vector for transgene delivery into mammalian cells. The vector comprises a chimeric genetic construct with a transgene operably linked to at least two distinct posttranscriptional regulatory elements. e.g. WPRE element, APPS'UTR, tau3'UTR or TH3'UTR region. The transfer comprises the nuclectide sequence of 609, 95, 237 and 91 bp, respectively ADD67513-ADD67516. The vector comprises a promoter controlling transcription of the transgene in the mammalian cells, a marker gene and a polyadenylation signal operably linked to the controlling transcription of the transgene in the mammalian cells, a marker gene and a polyadenylation signal operably linked to the cransgene. The vector is a plasmid or a recombinant virus. The vector or recombinant cell is used for the manufacture of a medicament for treating a disease. The vector, recombinant cell or composition is useful for treating a human disease, e.g. neurodegenerative diseases selected from Parkinson's disease or retinal degenerative diseases. They can also be used in experiments research or prophylactic areas. The current sequence correpresents the WPRE element nucleotide sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            8
                                                                                                                                    The invention relates to a novel porcine uroplakin II gene promoter (I).

An expression vector containing the promoter is useful in a method of producing useful proteins which involves implanting the vector into a surrogate mother animal, obtaining transgenic animals from the surrogate mother animal. Detaining transgenic animals from the unine of the transgenic animals. The promoter, the expression vector, and the transgenic animals. The promoter, the expression vector, and the transgenic animal can be used in the producion field of useful proteins that are medicinally valuable. The promoter promotes the bladder-specific expression of a target protein at high efficiency. An animal which was transformed using the promoter, so as to express the target protein content in its urine at high concentration, and the protein thus produced shows a superior physiological activity to that of the same kind of the existing protein. This sequence represents the administration of the concentranslation and the produced shows a superior physiological activity to that of the same kind of the existing protein. This sequence represents the administration and the produced shows a superior physiological activity to that of the same kind of the existing protein.                                                                                                                                                                                                                                                  The invention relates to a method for producing a transgenic animal for commercial use, which comprises transfecting a packaging cell line with retroviral construct, recovering recombinant retrovirus from the cell line and infecting embryonic cell with the recombinant virus. The method is useful in producing transgenic animals using retroviral constructs engineered to carry a transgene of interest. The transgenic animals may find use in commercial applications like biotechnology and agriculture. The present sequence is Hilaphicomes chimneric construct DNA comprising Human immunodeficiency virus type 1 (HIV-1) NL4.3 flap sequence, green fluorescent protein (GFP) variant encoding sequence, human ubiquitin promoter sequence and Woodchuck hepatitis virus regulator element (WRE). This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Producing a transgenic bird or fish for commercial use, comprises transfecting a packaging cell line with retroviral construct, recovering
Producing a transgenic animal for commercial use, comprises transfecting
                                a packaging cell line with retroviral construct, recovering recombinant retrovirus from the cell line and infecting embryonic cell with the recombinant virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       HIV-1 flap + ubiquitin + GFP + WRE construct DNA sequence SEQ ID NO:8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 TGCCTTGCCCGCTGCTGGACAGGGCTCTCGTTGGGCACTGACAATTCCGTGGTTG

The present invention describes a method for producing a transgenic bird or fish. The method comprises transfecting a packaging cell line with a retroviral construct, recovering recombinant retroviral particles from the packaging cell line, and infecting a bird or a fish egg with the recombinant retroviral particles. The retroviral construct comprises the recombinant retroviral particles. The retroviral construct comprises the self-inactivating 3' lentiviral LTR. Also described is a transgenic bird or fish made by the above method and whose genome comprises a proviral DNA that has a self-inactivating 3' lentiviral LTR. The method is useful in producing transgenic animals, particularly transgenic birds and fish, using retroviral constructs engineered to carry a transgene of interest. The method is used to introduce the gene of choice into animals in order to confer upon them desired attributes. The transgenic animals may find use in commercial applications like biotechnology and agriculture. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a nucleic acid molecule capable of expressing a lysosomal enzyme. The nucleic acid molecule comprises at least a sequence coding for the lysosomal enzyme and a promoter highly active in the brain inserted upstream from the sequence. Compositions and methods of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             diseases e.g. Gaucher type I disease, Hurler disease (MPSI) or Sanfilippo disease (MPSIII) in humans. The invention is also useful in gene therapy. The present sequence is a DNA related to the invention.
                              The specification describes the use of a viral vector system for transducing a target adipose tissue site. The viral vector system is useful for transducing a target adipose tissue site, in the manufacture of a pharmaceutical composition for treating and/or preventing a disease associated with a derangement in the metabolism of adipose tissue, such as obesity and diabetes. The viral vector system is also useful for treating and preventing a disease associated with death or impaired function of adipose tissue cells, a disease associated with hereditary blood disorders, and vascular diseases. The present sequence represents plasmid pSmart 5'cppt, which is used to construct vectors for use in the
                                                                                                                                                                                                                                                                                                                                                                                          09

The nucleic acid is used to produce an adenovirus vector particle, deliver an exogenous gene to a target cell, pseudotype recombinant viral vectors, target an adenovirus vector to a cell, produce a modified adenovirus, deliver a heterologous gene to an animal and produce a gutless adenoviral vector particle. The present sequence represents plasmid pDV90, which contains a TPL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid comprising an adenovirus tripartite leader nucleotide for producing high-capacity and targeted vectors for adenovirus-based
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 TGCCTTGCCCGCTGCTGGACAGGGCTCGGCTGTTGGGCACTGACAATTCCGTGGTGTTG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a nucleic acid molecule capable of expressing a lysosomal enzyme. The nucleic acid molecule comprises at least a sequence coding for the lysosomal enzyme and a promoter highly active in the brain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       inserted upstream from the sequence. Compositions and methods of the invention are useful for preventing or treating lysosomal storage diseases e.g. Gaucher type I disease, Hurlar disease (MPSII) or Sanfilippo disease (MPSIII) in humans. The invention is also useful in gene therapy. The present sequence is a DNA related to the invention.
                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 TGCCTTGCCCGCTGCTGGACAGGGCTCGGCTGTTGGGCCACTGACAATTCCGTGGTGTTG 60

Novel isolated nucleic acid molecule useful for delivering heterologous gene to human or any animal, or for producing gutless adenoviral vector particle.

Claim 10, SEQ ID NO 65; 157pp; English.

The invention describes an isolated nucleic acid molecule (I) comprising an adenovirus tripartite leader (TPL) nuclectide, the TPL nuclectide an adenovirus tripartite leader (TPL) nuclectide, the TPL nuclectide comprising a first and second different TPL exons chosen first, second and third same or different TPL exons, the TPL exons chosen from complete or partial TPL exon, complete TPL exon 2 and complete TPL exon 3. (I) is useful for delivery of an animal, or for producing a gutless adenoviral vector particle. A recombinant adenovirus particle (II) is useful for delivery of an amount of (II) sufficient to infect the cell. A helper-independent complements recombinant adenovirus vector genome (III) is useful for producing an adenovirus vector particle containing (III) which involves providing a packaging cell line which complements replication and packaging of the genome and (III) which is deficient in expressing packaging of the genome and (III) which is deficient in expressing containing particles and harvesting the particle produced by the cell containing particles and harvesting the particle produced by the cell containing particles and harvesting the particle produced by the cell containing particles and harvesting the particle produced by the cell containing particles and harvesting the particle produced by the cell containing particles and harvesting the demovirus vector. (III) is also useful for specifically calpendent adenovirus vector to a cell of choice. (I) is useful for readucing proliferation of tumour cells in a subject, or capture, and for reducing proliferation of tumour cells in a subject, or containing particles and particles represents a fibre expression containing a particle or cell seaful cor represents a fibre expression containing particles and particles or expression containing particles and particles or expression containing particles and particles and particles and particles are particles and particles are particles and particles and particles are particles and particles are particles construct containing a post-transcriptional regulatory element

The invention relates to a novel method for screening for inducers or inhibitors of a DNA repair pathway by contacting at least one component of a DNA repair pathway with a non-circularized retroviral cDNA in the presence and absence of a test compound, and determining whether circularization of the cDNA is increased or decreased in the presence of the test compound. The DNA repair pathway components have the following activities: anti-HIV, cytostatio, virucide, antidiabetic, and neuroprotective. The method is useful for identifying compounds that used in manufacturing a pharmaceutical composition for the treatment of a retroviral infection (e.g. AIDS, HIV infection, cancer, human adult Tection (e.g. AIDS, HIV infection, cancer, human adult Tection or for inereasing the efficiency virus, Type I diabetes or multiple sclerosis) or for increasing the efficiency of gene delivery in a gene therapy. This polymucleotide represents a retroviral cDNA Sequence 9731 BP; 2444 A; 2412 C; 2548 G; 2327 T; 0 U; 0 Other; Length 9731; Query Match 100.0%; Score 101; DB 11; Best Local Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel method for screening for inducers or inhibitors of a DNA repair pathway by contacting at least one component of a DNA repair pathway by contacting at least one component presence and absence of a test compound, and determining whether the cest compound. The DNA is increased or decreased in the presence of activities compound. The DNA repair pathway components have the following activities: anti-HIV, cytostatic, virucide, antidiabetic, and neuroprotective. The method is useful for identifying compounds that used in manufacturing a pharmaceutical composition for the treatment of a retroviral infection (e.g. AIDS, HIV) infection, cancer, human adult T-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       inducer; inhibitor; DNA repair pathway; anti-HIV; cytostatic; virucide; antidiabetic; neuroprotective; retroviral infection; AIDS; HIV infection; cancer; human adult T-cell leukaemia; lymphoma; feline immunodeficiency virus; Type I diabetes; multiple sclerosis; gene therapy; human; cyclic; circular; MSH2 promoter; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Screening for compounds that modulate a DNA repair pathway and/or retroviral integration, useful for treating retroviral infection, comprises determining the amount of a retroviral cDNA circularization in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cell leukaemia, lymphoma, feline immunodeficiency virus, Type I diabetes or multiple sclerosis) or for increasing the efficiency of gene delivery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 TGCCTTGCCCGCTGCTGGACAGGGCTCTCGGCTGTTGGGCACTGACAATTCCGTGGTGTTG

Staphylococcus aureus -in the production of anti-Polynucleotide(s) and proteins derived from stored on computer readable medium and used S.aureus vaccines.

Claim 1; Page 2287; 3271pp; English.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or

                                                                                                                                                                                                                                                                                                                                                     ö
                 likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S. aureus infection. The polypeptides can also be used in a kit for the immunodetection of S. aureus in a sample. S. aureus is implicated in numerous human diseases, including cellulities, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, acalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating homologues of any of the S. aureus DNA sequences contained on the computer

translational start signal. In the examples, the 3' end of pKT241 was attached to the signal DNA sequence of the DNA fragment (19) for rat preproinaulin (see AAN10033). The closest identifiable promoter for the penicillinase gene in pKT218 (AAN10032) is located in the region 14 to 2 mucleotides before its translational start signal. In the examples, the fragment (CB6) for rat preproinaulin (see AAN10034)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The closest identifiable promoter for the penicilinase gene in pKT241 (AAN10031) is located in the region 14 to 20 nucleotides before its translational start signal. In the examples, the 3' end of pKT241 attached to the signal DNA sequence of the DNA fragment (19) for rat preproingulin (see AAN10033). The closest identifiable promoter for the penicillinase gene in pKT218 (AAN10032) is located in the region 14 to 2 nucleotides before its translational start signal. In the examples, the

PAIs are large fragments of DNA which comprise pathogenicity determinants. The sequences of the invention are taken from PAI IV and PAI V. PAI IV is located at approximately 64 min (near pheV) approximately 94 min (at pheR) on the E. coli chromosome and is supproximately 160 kb in size. Antibodies specific to the proteins encoded by the PAI open reading frames of the invention can be used in kits to detect uropathogenic E. coli. The proteins are used in vaccines to elicit strain J96
                                                                                                                                                New isolated uropathogenic E. coli nucleotide sequences - used to develop products for the detection of pathogenic E. coli and to elicit an immune response to pathogenic E. coli.
                                                                                                                                                                                                                                                                                                                                                                                                                      PAI; pathogenicity island; uropathogenic E. coli detection; PAI IV; pheR; PAI V; pheV; vaccine; protective immune response; ds.
                                                                                                                                Gaps
3' end of pKT218 was attached to the signal DNA sequence of the DNA fragment (CB6) for rat preproinsulin (see AAN10034)

Similar plasmids may be constructed where the seceretion signal may be coupled with eg. somatostatin, insulin, growth hormone, interferon, IL-2, gastric inhibitory peptide, influenza B SA, epidermal growth factor and thymosine-beta4. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recombinant vector for polypeptide secretion - contains signal peptide sequence directly bonded to peptide-coding sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Oshiden K;

        Sequence encodes beta-urogastrone under the control of a tac promoter. The peptide may be expressed from plasmid pUGT 150s in a transformed E.coli host. The plasmid may carry several separately expressing sequences comprising a tac promoter, SD site, signal peptide, and coding sequence, to produce beta-UG in high yield. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                  Expression vector contg. multiple information units is used to transform host all for increased prodn. of polypeptides.

An example of a sequence detected by a probe consisting of polyinosine, polydeoxyinosine, oligoinosine and/or oligodeoxyinosine is labeled. The sens man probe are hybridized and the existence of DNA in the product is detected. It can be used to detect the presence of malignant tumour. (Updated on 10-MAR-2003 to add missing OS field.)                                                                                                                                                                                                                                                                                                                                                                The present invention relates to Drosophila cell cycle progression proteins (AAM47572-AAM47608) and their coding sequences (ABA90366-ABA90520). The coding sequences and proteins are useful for identifying a substance capable of affecting the function of the corresponding gene, a substance capable of inhibiting the cell division cycle, or capable of inhibiting mitosis and/or meiosis. They can also be used in a method for treating a tumour or proliferative disorder, cardiovascular disorders (such as restenosis and cardiomyopathy), autoimmune disorders such as (glomerulonephritis and rheumatoid arthritis), dermatological disorders (such as speriesis), anticinflammatory, antifungal and antiparasitic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polynucleotides encoding cell cycle progression proteins, useful for treating a tumor or a proliferative disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Treponema pallidum infection; syphilis; Borrelia infection; animal; enzyme production; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polynucleotide sequence from the genome of Treponema pallidum.

Met(21),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New beta-urogastrone deriv. - has gastric acid secretion inhibition and proliferation promotion activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               tic enzymes such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The deriv. has various biological activities such as gastric acid secretion inhibiting action, or cell proliferation promoting action. If deriv. has the same biological or pharmacological activities as betaurogastrone. It is not susceptible to denaturation by oxidn. and is chemically stable. Deriv. has resistance to proteolytic enzymes such protease. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antiproliferative; cytostatic; cardiant; immunosuppressive; meiosis;

                                           The present invention relates to Drosophila cell cycle progression proteins (AAM47572-AAM47608) and their coding sequences (ABA90366-ABA90520). The coding sequences and proteins are useful for identifying a substance capable of affecting the function of the corresponding gene, a substance capable of inhibiting the cell division cycle, or capable of inhibiting mitosis and/or meiosis. They can also be used in a method for treating a tumour or proliferative disorder, cardiovascular disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9

AAX20500-21243 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detecting diseases related to Borrelia infections in animals, and for the production of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to a novel method for the optimisation of primer libraries. Specifically, it refers to increasing the affinity of short oligonucleotide primers, also known as extendable oligos (EOS), for their template sequences. The present invention describes improved methods for sequencing and the linear and exponential amplification of DNA that can be useful for PCR, RT-PCR, ligation chain reaction (LCR), rolling circle amplification, strand displacement amplification and isothermal DNA amplification. Accordingly, these extendable oligos with improved specificity and affinity are particularly important in fields ranging from biotechnology and agriculture to medical research. This polynucleotide sequence is the electropherogram of a DNA sequencing reaction that used the pUG19 plasmid and BIS4/T422 oligos, used in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              259 AGGGTTAFTGTCTCATGAGCGGATACATATTTGAATGTATTTAGAAAAAATAAACAAATAG 318

The invention relates to novel isolated prostate gland related nucleic acids (I) and polypeptides (II). (I) and (II) are useful for diagnosis, prevention, and/or treatment of diseases and/or disorders of the prostatite such as acute non-bacterial prostatitis, chronic non-bacterial prostatitis, prostaticis, prostatic on-bacterial prostatitis, prostaticis,                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel isolated prostate gland related polypeptide useful for diagnosis and treatment of disorders of prostate such as prostatodystonia, prostatosis, prostatitis, benign prostatic hypertrophy and malacoplakia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Gaps

This is the 5' sequence of the clone insert
Clone from S. Wiemann, Molecular Genome Analysis, German Cancer
Research Center (NFZ); Email s.wiemann@dkfz- heidelberg.de;
Berquenced by BMFZ (Biomedical Research Center at the Charite,
Berlin/Germany) within the cDNA sequencing consortium of the German
Genome Project.
                                                                                                                                                                                                                                                                              ö

/lab host="E. Col; strain XL10-Gold, T1-resistant, F-"
/clone lib="Coxytricha plasmid UUGCIO library"
/note="Vector: PWD42nv; Purified macronuclear chromosomal
DNA from Coxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligomucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWH42 (gi|4732114|gb|AF129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pwD42 (gi|4732114|gb|AR129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to

/note="Vector: PWD42nv; Purified macronuclear chromosomal DNA from Oxytricha trifallax was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. Coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

// (Lone lib="Coytricha trifallax was blunt end-repaired with DNA from Coytricha trifallax was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. Vector DNA was prepared from a derivative of pwpdz (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. Coli XII0-Gold (Stratagene) cells and selected for ampicillin resistance."

// (note="Vector: PWD42nv; Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWD42 (gi|4732114|gb|AR129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent B. Coli XL10-Gold (stratagene) cells
and selected for ampicillin resistance."

DNA from Oxytricha trifical ax was blunt end-repaired with a ligonucleotides were ligated to the blunt ends in high molar excess. Vector DNA was prepared from a derivative of plasmid R1. The vector was ligated with addrivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptors complement and transformed into chemically-competent E. Coli X10-Gold (Stratagene) cells and selected for ampicillin resistance."
